2. Citations and explanations

The application falls within the technical field of electronic package locker arrangements.

The closest prior art is described in document DE-A-10000830 (D1), which is acknowledged in the description of the present application. It discloses a method for depositing goods in a locker that is part of a locker arrangement with a computer-controlled electronic locking system. The locker is opened by entering numeric or alphanumeric input media, a chip card, biometric features and the like. A central computer, to which the locker arrangement is linked, manages access authorization. A general key is provided that can lock or unlock one or more lockers.

The present application, which is concerned with electronic package locker arrangements, differs from D1 by the claimed combination of users into user groups wherein a user is granted access to a selection of several functions in one locker arrangement depending on the group to which he is assigned (claim 1).

The problem addressed by the application, namely that of permitting the flexible use of a locker arrangement on the

basis of user groups, is not solved by document D1, either alone or in conjunction with any other prior art document. The idea of granting a limited choice of functions in a package locker system on the basis of assignment to a user group does not appear to have been applied before.

It is determined that the amended claims 1-9 satisfy the requirements of PCT Article 41, since the content of these claims is supported by the description.
